5.6 Fibonacci based Evidences

Under this main chapter, I will present evidences over the text of Quran, that suggest that there is also 19 based evidences exist when we generate codes with a similar coding pattern to Fibonacci. Numbers of Fibonacci sequence is generated with the sum of the two preceding numbers and the initial two numbers of the sequence are 0 and 1. So, based on the general Fibonacci sequence coding pattern, I infer the new coding pattern that can be applied to all the integer numbers. It is needless to summarize the importance of Fibonacci sequence numbers, which we observe its pattern in nature and daily life. Fibonacci Numbers has also the unique relationship with the Golden Ratio. If we take any two successive Fibonacci Numbers and calculate their ratio, the results are approximately the Golden Ratio. Fibonacci Numbers and the Golden Ratio is what we clearly observe in the nature from the body parts of humans to DNA double helix or plants structures like flower

petals to finance and so on. It is like one of the natural design patterns of creation. Therefore, hypothesizing that the Fibonacci coding pattern might also exist in the text structure of Quran within the 19 based coding system is a reasonable hypothesis as everything in nature was created by the same Creator with respect to his measures.

There were weak sources of information that caused me to contemplate about the Fibonacci coding pattern and also the 19 based system of Quran. I had been busy updating my book during the year 2022 and did not have time to try other potential codings in Quran. However, firstly, I randomly saw the below simple 19 based coding in a social media post and when I performed an internet search, I was able to find this online book material as potentially the first source of that code published in it ([Adams 2020](#)). However, I am still not sure about the first source of this code as I did not see an explanation about who found this code first in that book. Anyways, even in that online book, where this code was presented first, the following important questions were not addressed at all. Mainly, there was no explanation for why this a bit unusual coding pattern applied or what is this coding pattern about and why there is that additional 0 at the beginning of the number of the total verses number 6236. Therefore, the coding operation used looks like a bit stretching without such explanations, which does not exist in the book.

The shared code was the following: 6236 is the total number of numbered verses of Quran. If we take 06236 and sum each consecutive number of it with the previous one then we obtain 6859, which is exactly $19 \times 19 \times 19$. Here is the each operation to get this number.

$$0+6 = 6$$

$$6+2 = 8$$

$$2+3 = 5$$

$$3+6 = 9$$

These numbers make 6859 and it is exactly equal to $19 \times 19 \times 19$.

What could be the probability of such an observation? The probability of a number being multiple of $19 \times 19 \times 19$ is $1/(19 \times 19 \times 19) = 1/6859$. However, let's say we have 8 similar operations to generate similar numbers in total (total number of chapters, verses, words and letters in both 6236 and 6348 verses) that could be tried similarly. Therefore, it is fair to say the probability of such random observation alone could be like $8/6859 = 0.0011$. This is around 1.1 in 1000 trials and it looks still statistically very significant and would not be considered to be observed by chance from scientific point of view. Since this is not a random book but the book that is claimed to be from the Creator of everything and followed by around 1.8 billion people, then it is more likely to be by design.

However, since there was no explanation for the reason of the initial 0 used in the coding operation and also an unusual coding pattern applied, the code did not seem much interesting to me initially. Because, in my book all the 19 based codes that I designated as evidence has a reason and explanation for why that coding pattern was used. Namely, all the evidences are rule based and have a meaningful explanation for why that pattern is used. For example, one of the universal rules I established in my book for concatenation operation is that, "natural numbers (of the text) are concatenated in natural order". If there is an exception, I need to make the explanation of the reason for such special cases. Getting back to the main topic, the code I saw still looked interesting to me as is because it is not only multiple of 19 but it is also exactly equal to $19 \times 19 \times 19$. I thought, this is very unlikely, maybe there is something I could have not seen yet and that thought stuck in my mind and caused me to contemplate more about it.

In the same book of that code but at an unrelated section, there are some coding examples with Fibonacci numbers as well. However the two parts are not related in that book but independent. Regarding Fibonacci numbers, this information is shared in that book: "The sum of the first 37 primes is the 19th Fibonacci number". This number is 2584 (19×136) and it is also multiple of 19, from which we also see that the 19th Fibonacci number is also multiple of 19.

These are interesting information but just an interesting code like an isolated evidence or a strong fact as is without a rule based relation to 19 based system of the text of Quran. Then I decided to investigate more on the Fibonacci numbers and inferred a new Fibonacci coding pattern that can be applied to any single arbitrary integer number, which then allowed me to discover 19 based coding evidences with the Fibonacci coding pattern that exist over the text of Quran. In the number generation process of Fibonacci, the two preceding numbers are summed and a new Fibonacci number is generated. Also, it has to start with 0 as the initial number before starting with 1 for integers. However, we now want to apply Fibonacci coding pattern to any arbitrary number. In the digits of any integer number, the next digit is already known, therefore I just use apply the Fibonacci pattern among the digits of any integer number and generate a new number based in this pattern.

Therefore, this is an example that shows how I found that Fibonacci coding pattern can be applied to any number. Let's say we have the number 6236 and we want to apply the new Fibonacci coding pattern over it. We separate each digits of the selected number but start with 0 as we see in the Fibonacci sequence. Then we have these separate numbers sequence:

0 6 2 3 6

Then we apply the basic Fibonacci operation over these numbers, such that the two preceding numbers are summed and a new Fibonacci number is generated. Then we get each of these numbers:

$$0 + 6 = 6$$

$$6 + 2 = 8$$

$$2 + 3 = 5$$

$$3 + 6 = 9$$

And concatenation of each of these sums yields this new single number, 6859, as the final result. This example turns out to be the exact coding that initially caused me to think about Fibonacci and 19 based system. After inferring this Fibonacci coding pattern that can be applied to any arbitrary number then the 0 that was put at the beginning of 6236 became more meaningful. Also, the question of why we sum the two consecutive numbers was also answered. Therefore, my conclusion is that the code 6859 that is equal to $19 \times 19 \times 19$ is also an evidence alone, as it is based on a meaningful coding pattern that we observe in nature, which is Fibonacci numbers. However, I usually consider simpler codes as clues and test them in a big number that corresponds to the clue but represent the Quran in more detail. Therefore, the next step was to test this hypothesis over the full text of Quran at verse level data. Then, I discovered new evidences as I will present in the following sub-chapters.

Further facts on Fibonacci numbers and 19:

Before proceeding to the evidences let me share some more facts about Fibonacci numbers itself and its natural relation to number 19. I already mentioned above that the 19th Fibonacci number is 2584 and it is multiple of 19. This is true when we start counting from the first number 0 in the Fibonacci numbers. There are also the following facts:

The sum of all the numbers until the 19th Fibonacci number is 6764 and it is also multiple of 19. Here are all the 19 Fibonacci numbers that yields the sum as 6764:

0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987, 1597, 2584

The other fact is that, again starting from 0 as the first index of Fibonacci, not only the 19th Fibonacci number is multiple of 19 but also all the series of Fibonacci numbers at its index 19^n ($n=1,2,3,\dots$) are also multiple of 19. For example, Fibonacci(19), Fibonacci(19×19), Fibonacci($19 \times 19 \times 19$) and so on are all multiple of 19. Not all, but only some numbers with same property has this divisibility by 19 property and one of them is the number 19. For example, number 17 does not have this property with Fibonacci sequence.

5.6.1 Fibonacci Evidence on Verses

I had already shown that when we applied the Fibonacci coding pattern, which I derived and explained in the previous section, then the number of the numbered verses of Quran, 6236, yields the coding number 6859 and it is multiple of 19. Even more it is exactly equal to $19 \times 19 \times 19$.

Now, my hypothesis is as follows: That simple code was left as clue and it also exist in the full text of Quran considering verse level numbers all the special verse indexes.

This hypothesis is more interesting as we already have one additional information about the big coding number we obtain from the special verse indexes. In the evidence presented in Chapter 5.5.1, I already presented that the 12471 digits length big number that is obtained from the concatenation of all the special verse indexes in the natural order is multiple of 19. Now, in this chapter the hypothesis I describe tells that we will apply the Fibonacci coding pattern that I derived to this 12471 digits length big number and it should also be multiple of 19. When I tested this hypothesis I witnessed that this hypothesis is also true. I will present and prove below this coding that I considered as evidence since it is based on the clue Fibonacci coding over the number 6236.

Let's first write the function that will apply the Fibonacci coding pattern, which I derived and explained in the previous section, to any input integer number. I named this function as *codeFibSeq*.

```
codeFibSeq <- function(x){  
  # This function applies the Fibonacci coding pattern (as I  
  # described) to the input number  
  # It outputs a single number as the result.  
  # x should be character especially for long numbers.  
  b <- c()  
  a <- unlist(strsplit(as.character(x), split=""))  
  b <- c(b,a[1])  
  lena<- length(a) - 1  
  for( i in 1:lena ){  
    tmpb <- as.numeric(a[i])+as.numeric(a[i+1])  
    b<- c(b, tmpb )  
  }  
  return(paste0(b, collapse = ""))  
}  
  
# Example usage of this function on 6236.
```

```
# The result of the below example run must be 6859.  
codeFibSeq(6236)
```

```
## [1] "6859"
```

We now have the function to apply the Fibonacci coding pattern and generate the result as a single coding number. As seen above, when we input the number 6236, the result is 6859 and it is the base code example we already know and shows that the function works as intended.

Now, in this evidence we will input the special verse indexes of all the 6236 numbered verses as a single number concatenated in their natural order. Recall that this 12471 digits length big number itself is also multiple of 19 and is also another code evidence that was presented in Chapter 5.5.1. It also works for all the 6348 verses as there is no number for the special verse indexes and they both result the same big number after concatenation.

```
# The 6236 special verse indexes concatenated  
tmp <- paste0(nQuran$verse, collapse = "")  
# The length of this number is 12471 as seen:  
nchar(tmp)
```

```
## [1] 12471
```

```
# As we know this itself was an evidence and multiple of 19.  
as.bigz(tmp) %% 19 # As shown here again.
```

```
## Big Integer ('bigz') :  
## [1] 0
```

```
#Now we input this 12471 length big number to the codeFibSeq function  
tmp <-codeFibSeq(tmp) # The Fibonacci coding pattern is applied  
nchar(tmp) # Length of this resulting coding number
```

```
## [1] 16594
```

```
# As we see, this 16594 digits length coding number is also multiple of 19  
as.bigz(tmp) %% 19
```

```
## Big Integer ('bigz') :  
## [1] 0
```

As we witnessed, when we applied the Fibonacci coding pattern to the 12471 digits length big number of all the special verse indexes, which itself is multiple of 19, and generated the

“16594” digits length big number as its Fibonacci coding representation, then the resulting coding number is also multiple of 19 as hypothesized and thus tested. I consider this coding as evidence as I explained before it is based on the same coding that we observed the number 6236 itself and considered it as a clue or key coding pattern. They together suggest a design and hence considered within the overall 19 based system presented in this book.

As the general rule of the system of my book, I apply all the codings to both text type, namely, 6236 unnumbered verses only and also all the 6348 verses. However, since the additional 112 Basmala verses do not have numbers, the special verse indexes of the 6348 verses are also the exactly the same numbers of the numbered verses. Therefore, we can rightfully state that, this successful coding that we observed in the 6236 numbered verses also exist in all the 6348 verses too.

Then, we can count how many trials we could try with this coding, considering total level, chapter level and verse level numbers of the verse data of the text data. Because, this book has also the general rule as such, when we use a coding as a clue, we only test its correspondence in a bigger number at different level of the similar data. Namely, if the clue is based on verse number like the 6236 verses, then we test the verse numbers at the different levels like the verse indexes over verse level data.

In the total level numbers, we observed the successful key coding on the number 6236 and used it as the clue but not in the number 6348. The follow up codes that were based on it are considered as the evidences and counted in the global counters of this book for general probability calculations. In verse level data, we observed it on both of them as both numbers were same. In chapter level, we don't observe this key coding pattern. Therefore we can say that we performed 4 trials and observed 2 successes of this key coding pattern. The probability of such observation alone is 0.015 (with 2 success, 4 trials, $p=1/19$). One may wonder, why we do not observe this coding pattern in the chapter level data of the verse numbers. Maybe, it is because we have verse number as the clue and it is best to observe the evidence over the verse level data. Namely, maybe the chapter level data is not relevant here but I choose to be very conservative in the probability calculations and thus include the chapter level verse data as well in the probability calculations and thus I count 4 trials instead of 2. Now, let's also add these numbers into the global counters.

```
global_tested_nums <- global_tested_nums + 4
global_success_nums <- global_success_nums + 2
```

For the reference, to the best of my knowledge, Evidence 5.6.1 is also first time presented to the literature in this book, and it has been hypothesized, tested and discovered by myself. In case if I find out Evidence 5.6.1 had been available in another article, then, in such a case, I surely add a citation and update the online version of this book.

Also, here is the “16594” digits length big number:

5.6.2 Fibonacci Codes as Facts only

Under this chapter I will present further facts on the Fibonacci coding pattern. They look appealing but I preferred to present those codes currently just as **facts** but not as evidences as their potential rules are not fully clear to me yet.

5.6.2.1 Fibonacci Code on Chapters

If we apply the same Fibonacci coding pattern to the chapter indexes of the 6348 verses of the verse level data, then we again observe a resulting big number as multiple of 19 as I show below:

```
# Chapter indexes of each of 6348 verses
tmp <- paste0(unQuran$chapter, collapse = "")

#Now we input this 11430 digits length big number to the codeFibSeq function
tmp <-codeFibSeq(tmp) # The Fibonacci coding pattern is applied
nchar(tmp) # Length of this resulting number

## [1] 15676

as.bigz(tmp) %% 19 # As we see, this 15676 digits length number is multiple of 19

## Big Integer ('bigz') :
## [1] 0
```

5.6.2.2 Fibonacci Code on Words

If we apply the same Fibonacci coding pattern to words numbers of the 6236 verses of the verse level data, then we again observe a resulting big number as multiple of 19 as I prove below:

```
# Number of Words in each of 6236 verses
tmp <- paste0(nQuran$vwords, collapse = "")

#Now we input this 9580 digits length big number to the codeFibSeq function
tmp <-codeFibSeq(tmp) # The Fibonacci coding pattern is applied
nchar(tmp) # Length of this resulting number

## [1] 11902
```

```
as.bigz(tmp) %% 19 # As we see, this 11902 digits length number is
multiple of 19
```

```
## Big Integer ('bigz') :
## [1] 0
```

5.7 Overall probability of all the evidences so far

Below I will calculate the probability of all the evidences so far in this book using the global counters I have been counting.

```
tmp <-binom.test(global_success_nums,
                 global_tested_nums, p = (1/19),
                 alternative = c("greater"))
tmp <- formatC(tmp$p.value, format = "e", digits = 2)
print(paste("The probability of", global_success_nums,
            "success out of", global_tested_nums ,
            "(with p=1/19) is:", tmp))

## [1] "The probability of 40 success out of 93 (with p=1/19) is:
1.44e-26"
```

Again, if some cautious people think that we should have used more tests, although we tried **all** of them regarding the rules, I will not even look at the possible further successes in that case and keep the success number same but double the number of trials and see what would then be the overall probability so far. This should calm down those skeptical people.

```
tmp <-binom.test(global_success_nums,
                 global_tested_nums*2,
                 p = (1/19),
                 alternative = c("greater"))
tmp <- formatC(tmp$p.value, format = "e", digits = 2)
cat(paste("The probability of all the ", global_success_nums,
          "success out of all the", global_tested_nums*2,
          " tests (with p=1/19) is:", tmp))

## The probability of all the 40 success out of all the 186 tests
(with p=1/19) is: 2.63e-14
```

If still not convinced, for extremely cautious people, let's also increase the trials by 4 fold and keep the successes the same as below!

```
tmp <-binom.test(global_success_nums,
                 global_tested_nums*4,
```

```

p = (1/19),
alternative = c("greater"))
tmp <- formatC(tmp$p.value, format = "e", digits = 2)
cat(paste("The probability of all the ", global_success_nums,
"success out of all the", global_tested_nums*4,
" tests (with p=1/19) is:", tmp))

## The probability of all the 40 success out of all the 372 tests
(with p=1/19) is: 1.87e-05

```

5.8 Ha-Mim evidences

Under this main chapter, I will present codes around some of the *Disjointed letters* or also know as *mysterious letters* or, as in Arabic, *Huroof-al-Muqattaat*. In particular, I will present various codes of the Ha-Mim and also Ayn-Sin-Gaf *Disjointed letters*. I will also provide the rules that define how we construct **all** the possible codes regarding the rules. Since the codes I will present can be defined under meaningful rules, they suggest a 19 based system design of the Ha-Mim letters (ح, م) and also Ayn-Sin-Gaf (عسق) letters over the full text of Quran. I also discovered all the Ha-Mim and Ayn-Sin-Gaf codes that are based on over the full text of Quran and, to the best of my knowledge, only some local codes, namely the codes over several local chapters only, were known before. I will calculate the probability of observing all those codes that suggest a system, which might show that the observed system is statistical unlikely to occur by chance alone and thus it suggests that it might have been designed by the author of the text, God. However, as a general reminder, since my decision is based statistical calculations, we can never be sure and cannot use definitive conclusions. We observe what we see and decide with a scientific methodology by calculating the probability of the observations with the best of our ability. This is true for all scientific problems that requires statistical calculations for the best decision. So, God knows best and my conclusions are based with the best of my ability regarding what I observe and measure statistically.

Since there is no alternative writing versions of these letters (Ha-Mim and Ayn-Sin-Gaf), all the standard manuscripts (mushafs) of the Hafs recitation **must** have the same number of Ha-Mim and also Ayn-Sin-Gaf letters. Therefore, the evidences presented about Ha-Mim and Ayn-Sin-Gaf letters are considered universal as they are valid for all the common Hafs manuscripts.

Let's first get the numbers of *disjointed letters* over all the text of Quran, considering both text category, all the 6348 verses and also for only 6236 numbered verses.

```

require(stringr)
tmp <- unlist(str_split(Words, ""))
length(unique(tmp) )

## [1] 36

5.8.1 Sum of Ha-Mim letters in the full text of Quran

CODE: The total number of Ha-Mim letters in the full text of Quran is **30875** and it is also multiple of 19 when we consider the numbered 6236 verses (just like we observed it locally in their special chapters).

As already known, the total number of Ha-Mim letters is multiple of 19 in the chapters 40,41,42,43,44,45,46, where the chapters has the first isolated verse that only contains the Ha-Mim disjointed letters. This fact holds when we consider all the verses in those local 7 chapters just mentioned. This counting includes unnumbered Basmala verses too. This code has been a known fact for a long time and as far as I am aware of, Rashad Khalifa is cited as the first who found this fact. Although he is the “inventor” of an older 19 based claims about Quran, which is false as he manipulated the text, he also appears to have found a few interesting codes as this one, which is not in the full text of Quran but just in those 7 chapters for this code and thus this particular one does not include any manipulation of the text and might be taken serious. I said “inventor” because he manipulated the Quran text to match the text to his made up code claims and thus invented, namely made up. Mainly, he removed the last two verses of chapter 9 and made some letters changes in the text to match his made up false code claims. Scientifically, it is non-sense but this particular *local* Ha-Mim code, finding the sum of Ha-Mim letters in those 7 special chapters as multiple of 19, is based on the normal unchanged text as it is not within the parts he shamelessly manipulated. Therefore, I have to cite it though I would prefer not to because of his manipulations in his main claim. Also, I am normally not much interested in codes that is not derived from the full text of Quran. However, these kinds of small or local codes might

be considered as a sign or clue or key coding patterns and can direct us to look at similar codings in the full text of Quran. Another somewhat interesting fact with this small code is that the quotient of the total divided by 19 is equal to 113, which is the digit sum of each of the components that makes the total sum. These facts at least takes our attention to the Ha-Mim letters. In this book, I am mostly interested only in the codes that is derived from the **full text of Quran** and thus support the overall 19 System over the full text of Quran and consequently ensures its overall preservation from different aspects of the text. I am not that interested in codes that can be observed in parts of the text. However, these kinds of codes might be treated as potential signs or clues and we can look at similar coding patterns over the full text of Quran based on these clues. I followed this approach and discovered that the total number of Ha-Mim letters in the full text of Quran is **30875** and it is also multiple of 19 when we consider the numbered 6236 verses. As per the universal rule of this book, I *always* test all the codes in both text types, namely all the 6348 verses and also in 6236 numbered verses. I will provide the proof below but let me first prove the known fact, which is the sum of Ha-Mim letters in the 7 chapters (40 to 46), is really multiple of 19 and correct. Here is the proof for that:

```
require(stringr)
tmp <- unlist(str_split(unQuran$text[4172], "")[1]) #Ha mim
tmp

## [1] "م" "ح"

ix <- c(40:46)
ix

## [1] 40 41 42 43 44 45 46

i1<-match(tmp,colnames(HrfMatun))
i1

## [1] 13 31

#Keep only chapter level numbers of Ha-Mim in all the 6348 verses
# of chapters 40 to 46
x <- HrfMatun[ix,i1]
tmp <- sum(x)
cat("The total number of Ha-Mim letters in chapters 40 to 46 is ",
tmp)

## The total number of Ha-Mim letters in chapters 40 to 46 is 2147

tmp %% 19 # it is multiple of 19
```

```
## [1] 0
```

Moreover, the digit sum of the each components of the sum is 113. It is also the quotient resulted from the division of the sum by 19.

I considered this as a clue and hypothesized that the sum of Ha-Mim letters might also be multiple of 19 in the full text of Quran. I then tested and witnessed that the hypothesis was validated considering the full text of Quran over the 6236 numbered verses. Since, as a general rule, I test all codes in this book always in both text types (6348 and 6236), by the rule, I was able to discover this evidence because the local clue was observed considering the unnumbered verses, namely 6348 verses text type.

Below is the proof that the total number of Ha-Mim letters in the full text of Quran, regarding 6236 numbered verses, is multiple of 19.

```
x<-lettersEachn[i1]
x[1]

##      ح
4140 ##

x[2]

##      م
26735 ##

tmp <- sum(x)
cat("The total number of Ha-Mim letters in the numbered 6236 verses ",
tmp)

## The total number of Ha-Mim letters in the numbered 6236 verses
30875

# Test if mod 19 is zero:
tmp %% 19

## [1] 0
```

5.8.2 Ha-Mim-Ayn-Sin-Gaf Evidence and facts

CODE: The sum of Ha-Mim and Ayn-Sin-Gaf disjoint letters over the full text of Quran (in 6348 verses) is 53998 and it is also multiple of 19 (just like we observed it locally in the special chapters of these letters).

In Evidence 5.8.1, we witnessed that the sum of Ha and Mim letters in the full text of Quran is multiple of 19. We consider it as evidence because, first, the sum is the most basic and logical code to test, second, we initially observed this sum coding pattern locally on the chapters 40,41,42,43,44,45,46, where the chapters has the first isolated verse that only contains the Ha-Mim letters. So, basically I assumed that the code we observe is left as clue and used the same coding pattern as the rule and discovered the code over the full text of Quran and thus considered it as an evidence. However, there is one more interesting verse with other disjoint letters among those local chapters of Ha-Mim. In chapter 42, the first independent verse is Ha-Mim and the second independent verse is Ayn-Sin-Gaf (عسق). Therefore, I have also tested the same sum coding pattern, with all these 5 disjoint letters together. I took the sum of all Ha-Mim and added the sum of Ayn-Sin-Gaf in the chapter 42 and observed that the grand total is also multiple of 19 in those 7 chapters. As a side note, since the Ha-Mim sum was already multiple of 19 in those 7 chapters, therefore the sum of Ayn-Sin-Gaf in the chapter 42 must also be multiple of 19 so that the grand total of the combination of Ha-Mim and Ayn-Sin-Gaf becomes multiple of 19 too. This is what I observed, namely, the sum of Ayn-Sin-Gaf in the chapter 42 is also multiple of 19. However, since these 5 disjoint letters comes in combination we are interested in the sum of the combination but not Ayn-Sin-Gaf alone. Similar to the previous evidence of Ha-Mim, when I use the locally observed code as a clue and test the same coding pattern over the full text of Quran, then I discovered the evidence I present in this chapter. Namely, the sum of Ha-Mim and Ayn-Sin-Gaf disjoint letters over the full text of Quran is also multiple of 19 just like we observed it locally in their chapters.

As per the universal rule of this book, I test all the codes in both text types, namely all the 6348 verses and also in 6236 numbered verses only. I will provide the proof below but let me first prove the known fact that the sum of Ha-Mim letters in the 7 chapters (40 to 46) and Ayn-Sin-Gaf in the chapter 42 is multiple of 19 and correct. Here is the proof for the local code:

```
require(stringr)
tmp <- unlist(str_split(unQuran$text[41:72], "")) #Ha mim
tmp

## [1] "م" "ح"

ix <- c(40:46)
ix

## [1] 40 41 42 43 44 45 46

i1<-match(tmp,colnames(HrfMatun))
i1
```

```
## [1] 13 31

#Keep only chapter level numbers of Ha-Mim in all the 6348 verses
# of chapters 40 to 46
x <- HrfMatun[ix,i1]
tmp <- sum(x)
cat("The total number of Ha-Mim letters in chapters 40 to 46 is ",
tmp)

## The total number of Ha-Mim letters in chapters 40 to 46 is 2147

tmp %% 19 # it is multiple of 19

## [1] 0
```

Now,let's see the sum of Ayn-Sin-Gaf in the chapter 42, which is multiple of 19 too.

```
require(stringr)
tmp <- unlist(str_split(unQuran$text[4314], " ")[1]) #Ayn-Sin-Gaf
tmp

## [1] "ع" "س" "ق"

i42 <- c(42)
ig<-match(tmp,colnames(HrfMatun))
ig

## [1] 25 19 28

#Keep only chapter level numbers of Ha-Mim in all the 6348 verses of
chapters 40 to 46
x <- HrfMatun[i42,ig]
tmp <- sum(x)
cat("The total number of Ayn-Sin-Gaf letters in chapter 42 ", tmp)

## The total number of Ayn-Sin-Gaf letters in chapter 42 209

# Test if mod 19 is zero
tmp %% 19

## [1] 0
```

Now, we observed **locally** that the sum of those 5 disjoint letters are multiple of 19 in their associated local chapters considering 6348 verses text category We then test this code in the full text of Quran. Because, I considered this as a clue and hypothesized that the sum of

Ha-Mim and also Ayn-Sin-Gaf together might also be multiple of 19 in the full text of Quran too. When tested, it is validated considering the full text of Quran of the all the 6348 verses.

Below is the proof that the total number of Ha-Mim-Ayn-Sin-Gaf letters in the full text of Quran, regarding all the 6348 verses, is multiple of 19 as shown below:

```
which(names(LettersEachun) == "ح")
## [1] 13

#13
which(names(LettersEachun) == "م")
## [1] 31

#39
which(names(LettersEachun) == "ع")
## [1] 25

#25
which(names(LettersEachun) == "س")
## [1] 19

#19
which(names(LettersEachun) == "ق")
## [1] 28

#28

ih <- c(13,31,25,19,28) #The indexes of Ha-Mim-Ayn-Sin-Gaf letters in
the LettersEachun object.

#Considering 6348 verses the sum is multiple of 19
tmp <- LettersEachun[ih]
tmp[1] #Ha

##      ح
4364 ##

tmp[2] #Mim
```

```

##      م
27071 ##

tmp[3]  #Ayn

##      ع
9405 ##

tmp[4]  #Sin

##      س
6124 ##

tmp[5]  #Gaf

##      ق
7034 ##

tmp <- sum(LettersEachun[ih]) # Should be 53998
cat("The total number of Ha-Mim-Ayn-Sin-Gaf letters in all the 6348
verses is ", tmp)

## The total number of Ha-Mim-Ayn-Sin-Gaf letters in all the 6348
verses is 53998

# Test mod 19
tmp %% 19

## [1] 0

#Proof of an additional Fact:
# Considering 6236 verses, the digit sum of the sum is exactly 19
lettersEachn[ih]

## tmp
##      ح      م      ع      س      ق
7034  6012  9405  26735  4140  ##

tmp <- sum(lettersEachn[ih])
digitsum(tmp) %% 19 # Should be 53326

## [1] 0

```

As we observed, the total number of Ha-Mim-Ayn-Sin-Gaf letters in the full text of Quran in all the 6348 verses is **53998**, which is multiple of 19 as 19×2842 . I consider this as

evidence since we observed the same key coding pattern locally first and also observed it in the full text of Quran based on that.

Fact 1: Digit sum of the sum in 6236 verses. When we look at the total number of Ha-Mim-Ayn-Sin-Gaf letters in the numbered 6236 verses, it is 53326. As a supporting **fact**, but not as evidence, the digit sum of it is exactly 19 in this case.

Fact 2, Concatenation in 6348 verses:

When we concatenate each of the individual total numbers of Ha-Mim-Ayn-Sin-Gaf letters in all the 6348 verses with their natural orders as appears in the Chapter 42 Verse 1 as Ha-Mim and Chapter 42 Verse 2 as Ayn-Sin-Gaf, then the resulting number is 436427071940561247034 and it is also multiple of 19 as shown below:

```
ih <- c(13,31,25,19,28) #The indexes of Ha-Mim-Ayn-Sin-Gaf letters.  
#Considering 6348 verses the concatenation is multiple of 19
```

```
tmp <- LettersEachun[ih]  
tmp[1] #Ha
```

```
##      ح  
4364 ##
```

```
tmp[2] #Mim
```

```
##      م  
27071 ##
```

```
tmp[3] #Ayn
```

```
##      ع  
9405 ##
```

```
tmp[4] #Sin
```

```
##      س  
6124 ##
```

```
tmp[5] #Gaf
```

```
##      ق  
7034 ##
```

```

tmp <- paste0(tmp, collapse = '')
#The concatenated number:
tmp

## [1] "436427071940561247034"

#Mod 19 test
as.bigz(tmp) %% 19

## Big Integer ('bigz') :
## [1] 0

```

5.8.3 Rules and Probability of the codes with chapter level Ha-Mim counts

I only presented the two codes as evidences (Code 5.8.1, Code 5.8.2,) and considered them as part of the general 19 based system that I present in this book. The rule to get the coding pattern of these two codes are simple and straight forward. We observe the most simple coding pattern, which is the sum of all the numbers, in the local chapters of the two disjoint letters categories as we observe in Quran, which are Ha-Mim and Ha-Mim-Ayn-Sin-Gaf together. Therefore we hypothesized that they might be left as clues and we tested the same coding patterns over the full text of Quran and observed them in the full text of Quran as well. Since the numbers, are small we can compute the probability directly as below.

For Ha-Mim, we have 2 trials and 1 success with $p=1/19$. Therefore the probability of observing this is $2/19$. Similarly, For Ha-Mim-Ayn-Sin-Gaf together, we have 2 trials and 1 success and thus the probability of observing this is $2/19$. Observing these two event together is $2/19 \times 2/19 = 0.011$, which is around 1.1%, or roughly 1 in 91.

Let's now add the 4 trials and of 2 success of the above two evidences into the global counters.

```

global_tested_nums <- global_tested_nums + 4
global_success_nums <- global_success_nums + 2

```

I designated the rest of the interesting related codes just as facts and will not compute the probabilities of them as they are not part of the main system I present in this book. There might be an interesting rule based system that these codes might be part of but I might not have been able to discover yet. Therefore, I am presenting them here in case they might help to other researchers. On the other hand, they are still very interesting as facts here too.

5.8.4 Facts on disjointed letters

I will present some potentially interesting codes as *facts* about Ha-Mim letters under this main chaapter.

5.8.4.1 Fact: Digit sum of chapter level numbers

We have observed in Evidence 5.8.1 that the total number of Ha-Mim letters of the full text of Quran is multiple of 19. In this code, we will witness that the digit sum of the chapter level numbers that makes up the total sum is also multiple of 19. Basically we count the number of each Ha and Mim letters in each chapter of the 114 chapters considering again the text type with 6236 numbered verses. The sum of those counts make the grand total of 30875 and it was multiple of 19 as we already know Evidence 5.8.1. In this code, we will see that the digit sum of all the digits of the chapter level data that makes this big number is also multiple of 19 as shown below:

```
x<-hrfMatn[,il]
tmp <- digitsum(x)
cat("The digit sum of the number of Ha-Mim letters in all chapters ",
tmp)

## The digit sum of the number of Ha-Mim letters in all chapters  1805

tmp %% 19 # it is multiple of 19

## [1] 0

tmp/(19*19)

## [1] 5
```

Moreover the digits sum is not only multiple of 19 but is multiple of 19×19 , which is $19 \times 19 \times 5 = 1805$. Basically, the digit sum of all the numbers in the following table is multiple of 19, not only once but twice. In order to simplify the coding pattern, I formulate it below as follows:

DS([HM] [HM]...[HM])

Here, DS refers to digit sum operation that is applied to all the numbers in the brackets. *H* represents the number of *Ha* letters and *M* represents the number of *Mim* letters in a chapter. Each squared bracket represents the number of one chapter and they are concatenated to the adjacent numbers in the squared brackets. Although order is not important for an overall digit sum operation, they are in the natural order per the universal rule: "Natural numbers concatenated in the natural order". Here, the most left number is for chapter 1 of Quran and the right most number is for the last chapter, chapter 114. The following is the proof of this code. Here are all the counts of Ha and Mim letters in Quran considering the 6236 numbered verses:

```

x<-data.table(x)
x <- cbind(c(1:114),x)
colnames(x) <- c("chapter", "Ha", "Mim")
datatable(x,
  caption = 'Table of the counts of Ha-Mim at each chapter of
6236 numbered verses',
  extensions = c('Buttons'),
  options = list(pageLength = 5, autoWidth = TRUE,
    dom = 'Blfrtip',buttons = c('excel') ),
  rownames= FALSE)

```

5.8.4.2 Fact: Digit sum concatenations of chapter level numbers

We have observed in Code 5.8.1 that the total number of Ha-Mim letters of the full text of Quran is multiple of 19. Moreover, we observed in Code 5.8.4.1 that the digit sum of all the numbers that make the total of the previous code is also multiple of 19. In this code, we will observe that the digit sum concatenation of the same components of the chapter level numbers that makes up the total sum is also multiple of 19. Basically we count the number of each Ha and Mim letters in each chapter of the 114 chapters considering again the text type with 6236 numbered verses. We then concatenate the digit sum of these numbers among chapters in the natural order. The resulting 205 digits length number is multiple of 19. In order to simplify the coding pattern, I formulate it below as follows:

[DS(HM)][DS(HM)]...[DS(HM)]

Here, DS refers to digit sum operation that is applied to the numbers in the brackets. *H* represents the number of *Ha* letters and *M* represents the number of *Mim* letters in a chapter. Each squared bracket represents the resulting digit sum number of one chapter and they are concatenated to the adjacent numbers in the squared brackets in the natural order. It is in the natural order per the universal rule: “Natural numbers concatenated in the natural order”. Here, the most left number is for chapter 1 of Quran and the right most number is for the last chapter, chapter 114. The following is the proof of this code:

```

x<-hrfMatn[,i1]
tmp<-c()
for(i in 1:nrow(x)) tmp <- c(tmp, paste0(x[i,], collapse = ""))
head(tmp)

## [1] "515"      "3282192" "1711246" "1961303" "1711039" "1601058"

tmp <- sapply(tmp, digitsum)
head(tmp)

```

```
##      515 3282192 1711246 1961303 1711039 1601058
##      11      27      22      23      22      21

tmp <- paste0(tmp, collapse = '')
as.bigz(tmp) %% 19

## Big Integer ('bigz') :
## [1] 0

cat("The length of the big number is ", nchar(tmp) )

## The length of the big number is 205
```

Here is the 205 digits length big number:

```
"112722232221202131293822201217362519262831192123172725241315111325261
2162115252522241217281312881517201712141817271871691516181916131918171
512991414101512171215172011101212181073464111641486491181019410673"
```

5.8.4.3 Fact: Concatenations of chapter level numbers

We have observed in Code 5.8.1, Code 5.8.4.1 and Code 5.8.4.2 that the total, digit sum and concatenation of digit sums of the numbers of Ha-Mim letters of the full text of Quran in each chapter is multiple of 19 considering 6236 numbered verses. In this code, we will witness that the concatenation of the number of Ha-Mim letters in each chapter is also multiple of 19 in the full text of Quran considering all the 6348 verses. This is the result of the universal rule of this book, where I test all the codes of this book, both, in all the 6348 verses text type and also in only 6236 numbered verses text type.

Basically we count the number of each Ha and Mim letters in each chapter of the 114 chapters considering the text type with all the 6348 verses. We then concatenate these numbers among chapters in the natural order. The resulting 490 digits length number is multiple of 19. In order to simplify the coding pattern, I formulate it below as follows:

[HM][HM)]...[HM]

Here, *H* represents the number of *Ha* letters and *M* represents the number of *Mim* letters in a chapter. Each squared bracket represents the number of one chapter and they are concatenated to the adjacent numbers in the squared brackets. It is in the natural order per the universal rule: "Natural numbers concatenated in the natural order". Here, the most left number is for chapter 1 of Quran and the right most number is for the last chapter, chapter 114. The following is the proof of this code:

```

x<-HrfMatun[,i1]
tmp<-c()
for(i in 1:nrow(x)) tmp <- c(tmp, paste0(x[i,], collapse = ""))
head(tmp)

## [1] "515"      "3302195" "1731249" "1981306" "1731042" "1621061"

tmp <- paste0(tmp, collapse = '')
as.bigz(tmp) %% 19

## Big Integer ('bigz') :
## [1] 0

cat("The length of the big number is ", nchar(tmp) )

## The length of the big number is 490

```

Here is the 490 digits length big number:

```

"515330219517312491981306173104216210611661164544581389641006548870210

6"

```

Here are all the counts of Ha and Mim letters in Quran considering all the 6348 verses:

```

x<-data.table(x)
x <- cbind(c(1:114),x)
colnames(x) <- c("chapter", "Ha", "Mim")
datatable(x,
  caption = 'Table of the counts of Ha-Mim at each chapter of
6348 verses',
  extensions = c('Buttons'),
  options = list(pageLength = 5, autoWidth = TRUE,
    dom = 'Blfrtip', buttons = c('excel')),
  rownames= FALSE)

```

5.8.4.4 Fact: Digit sum of verse level numbers

We observed in Fact 5.8.4.1 that the digit sum of the chapter level numbers of Ha and Mim letters is multiple of 19 in the text type with 6236 numbered verses. In this code, we will see that the exact same coding pattern also exist with verse level numbers of Ha and Mim letters too in the text type with all the 6348 verses. Basically we count the number of each Ha and Mim letters in each verse of all the 6348 verses and when we calculate the digit sum of these numbers, the result is 25954, which is also multiple of 19. The digit length of Ha and Mim count numbers makes 13249 digits length number when concatenated. In the below code, we will verify that this code is multiple of 19.

```
x<-hrfMat6348[,i1] #verse level Ha-Mim numbers assigned to x
tmp <- digitsum(x)
cat("The digit sum of the counts of Ha-Mim
    letters in all the 6348 verses is ", tmp)

## The digit sum of the counts of Ha-Mim
##      letters in all the 6348 verses is  25954

tmp %% 19 # it is multiple of 19

## [1] 0

tmp/19

## [1] 1366
```

Basically, the digit sum of all the numbers in the following table is multiple of 19. In order to simplify the coding pattern, I formulate it below as follows:

$$DS([HM][HM])\dots[HM])$$

Here, DS refers to digit sum operation that is applied to all the numbers in the brackets. *H* represents the number of *Ha* letters and *M* represents the number of *Mim* letters in a verse. Each squared bracket represents the resulting number of each verse and they are concatenated to the adjacent numbers in the squared brackets. Although order is not important for an overall digit sum operation, they are in the natural order per the universal rule: “Natural numbers concatenated in the natural order”. Here, the most left number is for verse 1 of Quran and the right most number is for the last verse, verse 6348 or in a formal notation chapter 114 verse 6.

Here are all the counts of Ha and Mim letters in Quran considering the 6348 verses:

```
x<-data.table(x)
x <- cbind(unQuran$chapter,unQuran$verse,x)
colnames(x) <- c("chapter","verse", "Ha", "Mim")
datatable(x,
  caption = 'Table of the counts of Ha-Mim
  at each verse of all the 6348 verses',
  extensions = c('Buttons'),
  options = list(pageLength = 5, autoWidth = TRUE,
    dom = 'Blfirtip',buttons = c('excel')),
  rownames= FALSE)
```

Let's also see the length of this big number as follows:

```
x<-hrfMat6348[,il] #verse level Ha-Mim numbers assigned to x
tmp <- paste0(x[,1],x[,2])
tmp <- paste0(tmp, collapse = '')
cat("The length of this big number is", nchar(tmp))

## The length of this big number is 13249
```

Here is the 13249 digits length big number if the code (Note that the digit sum of it is multiple of 19 but not itself.):

```

5.8.4.5 Fact: Concatenation of sums with verse level indexes

So far, all the codes we observed are without any chapter or verse index information. In the following codes, which are only facts, I will also include chapter index for chapter level numbers and also chapter and verse indexes for the verse level numbers of Ha and Mim letters and follow the same coding rule that we used before. Basically, these are the facts out of all the possible meaningful coding patterns with those numbers along with the global rules of the book. Since the codes must be meaningful, for example, I will not make any sum operation between a concatenated number and a normal number. On the other hand, as usual, since they are not based on systematic rule based system, I designated them as facts only but not as evidences.

In the following code, basically, we concatenate the chapter and verse indexes and also the sum of Ha and Mim letters. We use the 6236 numbered verses and the resulting 30676 digits length big number is multiple of 19. In order to simplify the coding pattern, I formulate it below as follows:

$$[cv[H+M]][cv[H+M]]....[cv[H+M]]$$

Here, H represents the number of *Ha* letters and M represents the number of *Mim* letters in a verse. The letters c and v here represents the chapter and verse indexes, respectively. Each of the outer squared brackets represents the representation number of one verse and they are concatenated with the number in next outer squared brackets. Order of the numbers is by the global rule, which is the natural order. Here, the most left number is for verse 1 of Quran and the right most number is for the last verse, verse 6236 or in a formal notation chapter 114 verse 6. Each of the ‘+’ is to get the sum of Ha and Mim letters in a verse.

In the below code, we will verify that this code is multiple of 19.

```

#verse level Ha-Mim sums assigned to x
x<- hrfMat6236[,i1]
#Get the verse level sum of Ha-Mim together
sx <- apply(x, 1, sum)
#concatenate them with indexes
tmp <- paste0(nQuran$chapter, nQuran$verse, sx)
head(tmp)

## [1] "115" "123" "134" "142" "150" "162"

tmp <- paste0(tmp, collapse = '')
as.bigz(tmp) %% 19

## Big Integer ('bigz') :
## [1] 0

cat("The length of this big number is", nchar(tmp))

## The length of this big number is 30676

```

Here are all the counts of Ha and Mim letters in Quran considering the 6236 numbered verses, which we used in the current code:

```

x<-data.table(x)
x <- cbind(nQuran$chapter,nQuran$verse,x)
colnames(x) <- c("chapter","verse", "Ha", "Mim")
datatable(x,
  caption = 'Table of the counts of Ha-Mim
at each verse of the 6236 numbered verses',
  extensions = c('Buttons'),
  options = list(pageLength = 5, autoWidth = TRUE,
    dom = 'Blfrtip',buttons = c('excel')),
  rownames= FALSE)

```

Here is the 30676 digits length big number of the code:

```

5.8.4.6 Digit sum of the concatenation of sums with verse level indexes

In Code 5.8.4.5, we observed that the concatenation of the chapter and verse indexes and also the sum of Ha and Mim letters considering the 6236 numbered verses is multiple of 19. In the code of this section, we will see that the digit sum of the exact same coding pattern is also multiple of 19, considering the text type with all the 6348 verses. In this code, the big number that comes from the concatenation is 31020 and the digit sum of it is 118940 that is multiple of 19. In this code, basically, we concatenate the chapter and verse indexes and

also the sum of Ha and Mim letters and calculate the digit sum of this big number considering all the 6348 verses In order to simplify the coding pattern, I formulate it below as follows:

$$DS([cv[H+M]][cv[H+M]]....[cv[H+M]])$$

Here, H represents the number of *Ha* letters and M represents the number of *Mim* letters in a verse. The letters c and v here represents the chapter and verse indexes, respectively. Here, DS refers to digit sum operation that is applied to all the numbers in the bracket. Each of the outer squared brackets represents the representation number of one verse and they are concatenated with the number in next outer squared brackets. Order of numbers is by the global rule, which is the natural order. Here, the most left number is for verse 1 of Quran and the right most number is for the last verse, verse 6348 or in a formal notation chapter 114 verse 6. Each of the '+' is to get the sum of Ha and Mim letters in a verse.

In the below code, we will verify that this code is multiple of 19.

```
#verse level Ha-Mim sums assigned to x
x<- hrfMat6348[,i1]
#Get the verse level sum of Ha-Mim together
sx <- apply(x, 1, sum)
#concatenate them with indexes
tmp <- paste0(unQuran$chapter, unQuran$verse, sx)
head(tmp)

## [1] "115" "123" "134" "142" "150" "162"

tmp <- paste0(tmp, collapse = '')
digitsum(tmp) %% 19

## [1] 0

cat("The length of this big number is", nchar(tmp))

## The length of this big number is 31132

cat("The digit sum of this big number is", digitsum(tmp))

## The digit sum of this big number is 118940
```

Here is the 31132 digits length big number of the code:

As two further facts, if we had used general verse indexes, from 1 to 6348, instead of the normal indexes like chapter and special verse indexes, then the same exact coding pattern of this section results 31404 digit length big number whose digit sum is 125248 that is multiple of 19 too. Namely, whether we use the normal chapter and special verse indexes together or the general verse indexes alone, in both cases, the same coding pattern yield a number which is multiple of 19. However, since I do not use the general verse indexes in the coding of Ha-Mim, following the rules, I do not count it as another code of evidences. Since this is additional to the normal coding pattern, it is interesting and I inform this further fact here. There is one more **further fact** on this coding pattern with the general verse index. The exact same coding pattern with the general verse index also exist if we look at only those 7 special chapters, which results 2103 digits length number, 8265, that is also multiple of 19. Chapters 40 to 46 are special for Ha-Mim letters as Ha-Mim letters appears as independent verses in them, which had led as to look at it over the full text of Quran as the sum of them in those 7 chapters is multiple of 19.

5.8.4.7 Concatenation of sums with verse level indexes

In Code 5.8.4.5, we observed that the concatenation of the chapter and verse indexes and also the sum of Ha and Mim letters considering the 6236 numbered verses is multiple of 19.

In this code, we observe that, not only concatenating the chapter and verse indexes and also the sum of Ha and Mim letters, but also sum of the chapter and verse indexes and also the sum of Ha and Mim letters is also multiple of 19. We use all the 6348 verses and the resulting 14970 digits length big number is multiple of 19. In order to simplify the coding pattern, I formulate it below as follows:

$$[c+v+H+M]][c+v+H+M]]....[c+v+H+M]$$

Here, H represents the number of *Ha* letters and M represents the number of *Mim* letters in a verse. The letters c and v here represents the chapter and verse indexes, respectively. Each of the outer squared brackets represents the representation number of one verse and they are concatenated with the number in next outer squared brackets. Order of numbers is by the global rule, which is the natural order. Here, the most left number is for verse 1 of Quran and the right most number is for the last verse, verse 6348 or in a formal notation chapter 114 verse 6. Each of the ‘+’ is to get the sum of Ha and Mim letters and also the chapter and verse indexes in a verse.

In the below code, we will verify that this code is multipl of 19.

```

#verse level Ha-Mim sums assigned to x
x<- hrfMat6348[,i1]
#Get the verse level sum of Ha-Mim together
sx <- apply(x, 1, sum)
#concatenate them with indexes
tmp <- unQuran$chapter + unQuran$verse + sx
head(tmp)

## [1] 7 6 8 7 6 9

tmp <- paste0(tmp, collapse = '')
as.bigz(tmp) %% 19

## Big Integer ('bigz') :
## [1] 0

cat("The length of this big number is", nchar(tmp))

## The length of this big number is 14970

```

As a further fact, the same exact coding pattern also exist if we look at only those 7 chapters, which results 907 digits length number that is also multiple of 19. Chapters 40 to 46 are special for Ha-Mim letters as Ha-Mim letters appears as independent verses in them, which had led as to look at it over the full text of Quran as the sum of them in those 7 chapters is multiple of 19.

Here is the 14970 digits length big number of the code of the current chapter:

5.9 All the Disjointed letters sum

As mentioned before, in Quran, there are *Disjointed letters* or also know as *mysterious letters* or, as in Arabic, *Huroof-al-Muqattaat*. They are considered mysterious by most as their meaning are not fully agreed upon among scholars. As an information coding expert, it is plausible to me that they might also be the additional information to design a 19 based code in the full text of Quran. They might also have real meanings but this does not prevent them to have such an additional function as well.

In this chapter, I will present a coding, which shows that the total number of all the 14 *disjointed letters* is multiple of 19. Below, I present all the letters characters exist in the Quran text I used, which was explained in detail in Chapter 8.1. Then, I show the set of 14 *disjointed letters* I used to calculate the sum of them. And then, I will show that the sum of the total number of the 14 *disjointed letters* is multiple of 19 in the full text of Quran in 6236 numbered verses. Furthermore, when we look at all the 6348 verses, I will also show that the digit sum of those numbers is also multiple of 19 in the full text of Quran considering all the 6348 verses.

#All the letters characters exist in the text of Quran I used

names(LettersEachun)

```
## [1] "ا" "ب" "ت" "ث" "ج" "ح" "خ" "د" "ذ" "ر" "ز" "س"
"و" "ه" "هـ" "ن" "م" "ل" "ك" "ق" "ف" "غ" "ع" "ظ" "ط" "ض" "ص" "ش" [20] ##
"ي" "ى" "ي"
```

*#The set of 14 *disjointed letters* I used*

hurufs <- **c**(

```
"ا",
"ل",
"م",
"ص",
"ر",
"ك",
"ط",
"ه",
"س",
"ي",
"ح",
"ق",
"ن"
```

```

ع" "
)
#Let's print them:
hurufs

## [1] "ع" "ن" "ق" "ح" "ي" "س" "ه" "ط" "ك" "ر" "ص" "م" "ل" "ا"

#Get the indexes of of the disjoint letters
i1 <- match(hurufs, names(lettersEachn))
i1 #7 30 31 21 17 29 23 33 19 36 13 28 32 25

## [1] 7 30 31 21 17 29 23 33 19 36 13 28 32 25

HurufsCleanSum6236 <- lettersEachn[i1]
names(HurufsCleanSum6236) #See the names

## [1] "ع" "ن" "ق" "ح" "ي" "س" "ه" "ط" "ك" "ر" "ص" "م" "ل" "ا"

HurufsCleanSum6348 <- LettersEachun[i1]

#the sum of the total number of the 14 *disjointed letters* in 6236 verses
tmp <- sum(HurufsCleanSum6236)
#The sum of the 14 *disjointed letters*:
tmp

## [1] 225397

#225397 (225397/19 = 11863 digitsum(11863)=19)
#Mod 19 test of the sum:
tmp %% 19

## [1] 0

#Also, the digit sum of the quotient, 11863, is also exactly 19.
tmp /19

## [1] 11863

#The digit sum of the sum of those numbers in 6348 verses
tmp <- sum(HurufsCleanSum6348)
tmp

## [1] 227413

```

```
digitsum(tmp)
```

```
## [1] 19
```

We observed 2 codes.

Code 1: In the 6236 numbered verses, the total number of the 14 *disjointed letters* is **225397** and it is multiple of 19. As an additional fact, after dividing 19, the digit sum of the quotient, 11863, is also exactly 19.

Code 2: In all the 6348 verses, the total number of the 14 *disjointed letters* is **227413** and the digit sum of it is exactly 19.

Considering all the 14 *disjointed letters*, the most rational way to test their relation to 19 is to look at the most simple code, which is the sum of them. Therefore, I consider that the total number of the 14 *disjointed letters* being 225397 and it is multiple of 19 as evidence. Although this code is very sensitive to the text I used, observing such a code looks quite meaningful. Observing the other code about the digit sum is being equal to 19 also support the conclusion about the main code as evidence. I will count this observation as 1 success in 2 trials and add to the global counters.

```
global_tested_nums <- global_tested_nums + 2  
global_success_nums <- global_success_nums + 1
```

5.9.1 Discussion and future works on other ‘Disjointed Letters’

In Chapter 5.8, I presented some codes around Ha-Mim and Ayn-Sin-Gaf letters, which are about only the 5 of the ‘*Disjointed Letters*’ or also known as *mysterious letters* or, as in Arabic, *Huroof-al-Muqattaat*. More details about them can be seen in <https://en.wikipedia.org/wiki/Muqatta%CA%BFat>. However, there are 14 Disjointed letters out of 28 Arabic letters and we observed 19 based codings on 5 of them. I wanted to test others as well but there are some uncertainties on the other letters. Some of the key letters like Alif and Ya might have different writings or usages. Also, there are various versions of Arabic letters and the total number of letter forms in the text of Quran I used is 36. Here are all the letter forms in the text of Quran I used:

ء, آ, أ, إ, إِي, ا, ب, ق, ت, ث, ج, ح, خ, د, ذ, ر, ز, س, ش, ص, ض, ط, ظ, ع, غ, ف, ق, ك, ل, م, ن, ه, و, ي

The reason I was able to work on Ha-Mim letters (ح, م) and also the Ayn-Sin-Gaf letters is because they do not have other letter forms nor alternative usages in the text and also they have clear 19 based coding in their special 7 chapters, which led me to look at the full text of Quran too. However, for other letters, there are some unknowns for me and I am not able to analyze them as clearly as the Ha-Mim and Ayn-Sin-Gaf letters and thus I stopped

my research at this stage until I may clarify my knowledge about the other letters too. Since I do not know Arabic, I tried to get help from other people with Arabic expertise about those letters but I could not get a help on that. I may have to look at them in the future if I can clarify all my questions about those letters.

On the other hand, here is my hypothesis about them that interested people can test themselves if they are sure about all the Arabic letters in regard to '*Disjointed Letters*'.

Hypothesis: For the '*Disjointed Letters*' combinations, the ones that appears as a single verse in some chapters, if they have clear 19 based codings in their special chapters, like sum of them are multiple of 19, then they might also have clear 19 based codings in the full text of Quran too. Statistically significant portion of the *disjointed letters* or their special combinations as they appear in the beginning of the chapters as independent verse might follow this hypothesis.

5.10 Overall probability of all the evidences so far

Below I will calculate the probability of all the evidences so far in this book using the global counters I have been counting.

```
tmp <-binom.test(global_success_nums,
                 global_tested_nums, p = (1/19),
                 alternative = c("greater"))
tmp <- formatC(tmp$p.value, format = "e", digits = 2)
print(paste("The probability of", global_success_nums,
            "success out of", global_tested_nums ,
            "(with p=1/19) is:", tmp))

## [1] "The probability of 43 success out of 99 (with p=1/19) is:
1.17e-28"
```

Again, If some cautious people think that we should have used more tests, although we tried **all** of them regarding the rules, I will not even look at the possible further successes in that case and keep the success number same but double the number of trials and see what would then be the overall probability so far. This should calm down those skeptical people.

```
tmp <-binom.test(global_success_nums,
                 global_tested_nums*2,
                 p = (1/19),
                 alternative = c("greater"))
tmp <- formatC(tmp$p.value, format = "e", digits = 2)
cat(paste("The probability of all the ", global_success_nums,
```

```

    "success out of all the", global_tested_nums*2,
    " tests (with p=1/19) is:", tmp))

## The probability of all the 43 success out of all the 198 tests
(with p=1/19) is: 2.01e-15

```

If still not convinced, for extremely cautious people, let's also increase the trials by 4 fold and keep the successes the same!

```

tmp <-binom.test(global_success_nums,
                 global_tested_nums*4,
                 p = (1/19),
                 alternative = c("greater"))
tmp <- formatC(tmp$p.value, format = "e", digits = 2)
cat(paste("The probability of all the ", global_success_nums,
          "success out of all the", global_tested_nums*4,
          " tests (with p=1/19) is:", tmp))

## The probability of all the 43 success out of all the 396 tests
(with p=1/19) is: 7.36e-06

```

6 Other Evidences and Facts

In the previous two main chapters, I presented the key coding pattern based evidences and universal evidences. The other evidences and facts will be presented in this chapter. Most of this chapter presents codes as facts.

Regarding the codes presented in this chapter as **facts**, you can skip them if you like as they are not counted within the rule based 19 System presented in this book. I considered some of the codes just as *facts* and not as evidences and thus, they are not within the presented 19 System of this book but stands as additional information, which might be potentially useful in the future. You might skip the chapters with the codes as facts if you like. In this Chapter I will present some codes as **facts** that I did not consider them as evidences but designated as *facts* as I use general rules and would also like to see strong patterns to assign any coding as an evidence. However, sometimes I might be missing some other codings and these kind of facts help to discover them later and they might potentially be considered as evidences in the future. Also, sometimes some people might want to see if there is a specific relation if there is a coding in certain aspects. In such cases, some of these facts might be their answers. Also, some people might find them in the future and consider them as evidence by mistake. So, this chapter challenges them to find also meaningful rules

of such codes so that they might be considered as evidences. Therefore I present some of those codes as facts here as a separate section.

There is also another potential role of such codes. As I mentioned before, the author of the fake 19 system claim, Rashad Khalifa, who manipulated the text to match the text to his made up claim and his small amount of followers today and in the future potential similar other manipulators might come up codes with similar numbers over their manipulated text. In such case, these coding facts will be available as facts that tell them that there are already interesting codes with similar text numbers in the original full text of Quran.

In the main chapters of this book, Chapter 4 and Chapter 5, I presented codes, **all** of which strongly suggest a 19 based design within the **full text** of Quran. All of those codes were bound by the general rules and also the special rules described of Chapter 4 for that chapter. As mentioned before, those codes mostly do not contain letter information and applicable to most of the common Hafs manuscripts (mushaf) texts of Quran. Because, some of the letters of some of the words might have been written differently even among Hafs manuscripts during the course of the history. These slight differences does not change the meaning of the word but just might cause writing the words with slightly different letters. The situation is similar to the British and American English words of *colour* and *color*, respectively. Therefore, most of the codes up until now in this book, deliberately do not include letter information but mostly word information along with chapter and verse information. This assures that the codes are valid for most of the Hafs manuscripts commonly used today.

However, I also discovered appealing and, in my opinion, interesting codes that include the letter information too, which I will present in this chapter.

In this chapter, I will present codes as facts, including letters based codes that are again mainly bound by the universal rules described in Chapter 3.2.1. For each sub-chapter of this chapter, I might describe the special rules of each coding patterns, which are additional to the universal rules. Because the codes of this chapter might have their own additional special rules. The common trait of all the special codes I present in this chapter is that, all should answer meaningful questions with meaningful multiple related codings that might be part of the system although I do not include them in the presented system yet. I will also validate and provide reproducible tests for a few of the known important 19 based codes on Quran text.

For most of the codings of this chapter, in order to complete this book in a shorter time, I could not spend much time to research on the potential rules based on the codings I observed. Therefore, I classified many very interesting coding patterns as **facts** but not as codes of the 19 system. However, in the future, researchers might spend more time on them and discover meaningful rules of the codings patterns along with their related codes as a

system. Therefore they are currently presented in this book as a supportive facts to the presented system.

Finally, for the reference, to the best of my knowledge, all the codes and facts presented in the Chapter 6 and its sub-chapters are first time presented to the literature in this book, and they have been hypothesized, tested and discovered by myself. If I later realize that any of them were published in any publication earlier than 2019, the first publication date of this book, then, in such a case, I surely add a citation and update the online version of this book.

6.1 Miracle of Iron as evidence

Iron, one of the most plentiful metals found on Earth, is an essential building block for life, which is required for all living things to sustain life. The number of protons in nucleus of iron is 26, which makes its atomic number 26 and thus this is a unique and universal number for iron element.

Iron is one of the names of the 114 chapters of Quran. The name of the chapter 57 is *Al-Hadid*, namely, *The Iron*. The word, *Al-Hadid*, is used in the verse with index 25 of the chapter 57. Considering the unnumbered (unindexed) Basmala verse that exists in the beginning of the chapter 57, the verse with the word, *Al-Hadid*, is the **26th** verse in chapter 57. There are already a few known miraculous evidences exist in this verse that stand so strong like an iron!

(Quran, 57:25) Indeed, We sent Our messengers with clear proofs, and with them We sent down the Scripture and the balance 'of justice' so that people may administer justice. And We sent down **iron** with its great might, benefits for humanity, and means for Allah to prove who 'is willing to' stand up for Him and His messengers without seeing Him. Surely Allah is All-Powerful, Almighty.

In the following subchapters of this chapter, I will first present widely known miraculous evidences about iron in Quran. I will then present, *the new mathematical miraculous codes of iron in Quran as evidences, which I discovered on December 1, 2023 and will present for the first time in (the upgraded version of) this book to the literature*. The following subchapters presents my new discoveries about the iron in Quran: Evidence 6.1.2, Evidence 6.1.3, Evidence 6.1.4 and Fact 6.1.8.

6.1.1 Known evidences of Iron in Quran

Known evidence 1 of iron in Quran: The Abjad (geometrical) value of the Arabic word (حديد) *Hadid* (Iron) is exactly 26, which is also the atomic number of iron! Pause a moment

and contemplate how likely such undeniable truths might exist in a book claimed to be from the creator of both facts.

Below is the calculation of the Abjad value of the word 'Hadid' (Iron):

```
suppressWarnings(require(gmp))
tmp <- unlist(str_split("حديـد", ""))
cat("Each of the letters in the word 'Hadid' (iron): ",
    tmp)

## Each of the letters in the word 'Hadid' (iron): ح د ي د

tmp <- AbjadSeqofaWord("حديـد", abjadL, abjadN2)
cat("Each of the Abjad numbers of each letter in the word
'Hadid' (iron): ",
    tmp)

## Each of the Abjad numbers of each letter in the word
'Hadid' (iron): 8 4 10 4

tmp <- AbjadSeqofaWordSumValue("حديـد")
cat("The Abjad number of the word 'Hadid' (Iron) is ", tmp)

## The Abjad number of the word 'Hadid' (Iron) is 26
```

Known evidence 2 of iron in Quran: The atomic number is used to uniquely identify ordinary chemical elements. The atomic number of iron is 26. This is a universal fact and known by science literature only since the 19th century. The word *The Iron* to be at the 26th verse, including the unnumbered Basmala verse at the beginning, stands as the first miraculous and universal evidence for the claim that the author of Quran and the creator of this universe are the same. At the time of Quran's revelation by around 632, no one knew the atomic number. After around 1300 years, scientists found this universal fact.

The above two universal evidences stand as iron level strong miraculous evidences that should be sufficient to prove that Quran is from the Creator of everything, God. These miraculous evidences should convince the people with knowledge but without prejudices and arrogance against Quran.

Moreover, the chapter index of this verse also stands as further supporting fact between the unique relation of the iron and Quran. *The Abjad number of the word "The Iron" (Al-Hadid) is 57. As mentioned before, the name of chapter 57 is also The Iron.*

Below is the calculation of the Abjad value of the word 'Al-Hadid' (The Iron):

```

tmp <- AbjadSeqofaWord("الحديد", abjadL, abjadN2)
cat("Each of the Abjad numbers of each letter in the word
'Hadid' (iron): ",
    tmp)

## Each of the Abjad numbers of each letter in the word
'Hadid' (iron):  1 30 8 4 10 4

tmp <- AbjadSeqofaWordSumValue("الحديد")
cat("The Abjad number of the word 'Al-Hadid' (The-Iron) is ", tmp)

## The Abjad number of the word 'Al-Hadid' (The-Iron) is  57

```

Known evidence 3 of iron in Quran: The chapter, The Iron, is the 57th chapter of Quran and it is in the middle or the center chapter considering all the 114 chapters of Quran. It is also a new scientific knowledge of 20th century that the inner core of the planet earth is a hot, **dense ball of (mostly) iron**. More details can be read about it from this article: education.nationalgeographic.org/resource/core. So, the the facts that the middle of earth and Quran having “The Iron” is no coincidence but another miraculous truth for the ones who have no prejudice and arrogance against Quran.

Natural iron is a mixture of four stable isotopes. Another additional fact is that, the number 57 is also the number of one of the 4 four stable isotopes of iron, which is *iron-57*.

Known evidence 4 of iron in Quran: This might be a bit controversial as the science might not have fully established about how exactly the iron on earth existed. In the verse, 57:25, there is this statement: “... And We **sent down iron** with its great might, benefits for humanity ...”. At the time of the revelation of Quran, humanity had no knowledge that iron had already existed naturally on earth or came down by meteorites. Although, there are various theories exist currently, one information is commonly accepted as a scientific fact, which is such that some of the iron on earth was definitely came down by meteorites. Since the verse does not say “we sent down all the iron”, I think, even the current limited scientific information verifies the statement of the verse. Since there was no such information that at least some iron came down to the earth by meteorites, the statement of Quran about the iron stands as another miraculous fact for the people of knowledge who have no prejudice and arrogance against Quran.

6.1.2 Entire Iron verse & atomic number of Iron: First new evidences of Iron

Simple code pattern reminder:

For the verse of Iron: [Chapter index | verse index | number of words | number of letters]

I have discovered additional evidences about “iron” and Quran on the date Dec 1, 2023. I have not seen them anywhere before. If I see a publication that already have them, I certainly update my book to cite them. However, to the best of my knowledge, they are all discovered by myself and first time presented to the literature in this book.

I will present each in a separate subchapter. The first new evidence is the following:

The verse of Iron, in its entirety, has further relation with the atomic number of iron, 26. Namely, when we concatenate, in the natural order, the chapter index (57), the verse index (25), the number of words in the verse (28) and the number of letters in the verse (138), we get the following big number and it is multiple of 26, which is the atomic number of iron. Here are the calculations:

Concatenate: 57 25 28 138

The coded number of the iron verse: 572528138

It is multiple of 26 as follows: $572528138 / 26 = 22020313$

This *suggests* that the Creator of the universe, who also created the iron is also the author of Quran, shows us these undeniable miraculous facts so that we, the people of knowledge, can contemplate and understand that the Quran is the message from God.

Quran, 41:53 We will show them Our signs in the universe and within themselves until it becomes clear to them that this 'Quran' is the truth. Is it not enough that your Lord is a Witness over all things?

A further interesting *fact* from this evidence is the following. The digit sum of the quotient, 22020313, is 13. This number is interesting because the word “the-iron” (Al-Hadid) is the 13th word in the iron verse, 57:25. This might or might not be a coincidence but it looked to me interesting and just shared as a fact but not as an evidence. I leave this fact for further discussion to the people to consider it as an evidence or not.

Here is the proof from Quran text:

```
x<- unQuran
tmpl <- str_split(x$text, " ")
i<- 5155 # General verse index in 6348 for verse 57:25, the hadid
verse.
tmpi<- unlist(tmpl[i])
print("Each of the words in the verse of (The-Iron), 57:25: ")

## [1] "Each of the words in the verse of (The-Iron), 57:25: "
print(tmpi)
```

```
## [1] "معهم" "وأزلنا" "بالبينات" "رسلنا" "أرسلنا" "لقد"
"وأزلنا" "بالقسط" "الناس" "ليقوم" "والميزان" "الكتاب" [7] ##
"للناس" "ومنافع" "شديد" "بأس" "فيه" "الحديد" [13] ##
"بالغيب" "ورسله" "ينصره" "من" "الله" "وليعلم" [19] ##
"عزيز" "قوي" "الله" "إن" [25] ##"

print("The number of letters in each word in the (The-Iron) verse: ")
## [1] "The number of letters in each word in the (The-Iron) verse: "

print(nchar(tmpi))

## [1] 3 6 5 8 7 4 6 8 5 5 6 7 6 3 3 4 6 5 6 4 2 5 5 6 2 4 3 4

print("The number of letters in the verse 57:25: ")
## [1] "The number of letters in the verse 57:25: "

print(sum(nchar(tmpi)))

## [1] 138
```

6.1.2.1 Entire Iron verse & atomic number of Iron: The number of characters per word

I also found a related code that is related to the previous evidence 6.1.2. In that code, if we keep the chapter 57 and verse 25 indexes but remove the number of words and letters and then place the number of characters per word, then the resulting code is also multiple of 26 as below:

See Chapter 6.1.2 to see the number of characters for each of the 28 words.

The number of characters for each of the 28 words as concatenated:

3658746855676334656425562434

We then concatenate the chapter 57 and verse 25 indexes with this big number and got the code as below:

57253658746855676334656425562434

This code number is also multiple of 26. Since this code is strongly related to the Evidence 6.1.2, I presented it as the subchapter of it to consider them together. Here is the test that show mod 26 of this big number is 0 and thus it is multiple of 26.

```
tmp <- "57253658746855676334656425562434"
as.bigz(tmp) %% 26
```

```
## Big Integer ('bigz') :  
## [1] 0
```

6.1.3 Iron verse until the word Iron & atomic number of Iron: Second new evidences of Iron

Simple code pattern reminder:

For the verse of Iron until and including the Iron word: [Chapter index | verse index | number of words | number of letters]

There is more interesting evidence if we look at the text numbers until the word *iron* in the iron verse, 57:25. The word, "Al-Hadid" (The-Iron) is the 13th word in this verse and up until the word *The-Iron*, inclusive, there are 76 letters. When we concatenate these natural numbers in the natural order as we did in the above evidence, Evidence 6.1.2, we witness further interesting evidence as the resulting number is also multiple of the atomic number of iron, 26. Here are the calculations:

Concatenate: 57 25 13 76

The coded number of the iron verse: 57251376

It is multiple of 26 as follows: $57251376 / 26 = 2201976$

This further *suggests* that the Creator of the universe, who also created the iron is also the author of Quran, shows us these undeniable miraculous facts so that we, the people of knowledge, can contemplate and understand that the Quran is the message from God.

There is further tiny interesting fact in the numbers of this evidence. The sum of those 4 numbers is also multiple of 19 as $57+25+13+76 = 171$, where $171/19 = 9$. By the way, the number of letters until the word, the-iron is 76 and $76/19 = 4$. This fact seemed to me a bit interesting because there are 4 isotopes iron made of. The letters are also components words are made of. The matching of the 4 regarding components of iron and the word iron seemed to be worth mentioning here and again I leave it for further discussion to the people.

Below are the R codes that shows each word and their word index and letters so that readers can verify the above mentioned numbers.

```
x<- unQuran  
tmpl <- str_split(x$text, " ")  
i<- 5155 # General verse index in 6348 for verse 57:25, the hadid  
verse.  
tmpi<- unlist(tmpl[i])  
print("until the 13th word (The-Iron), each of the words in the verse  
of , 57:25: ")
```

```

## [1] "until the 13th word (The-Iron), each of the words in the verse
of , 57:25: "

print(tmpi[1:13])

## [1] "معهم" "وأنزلنا" "بالبينات" "رسلنا" "أرسلنا" "لقد"
"وأنزلنا" "بالقسط" "الناس" "ليقوم" "والميزان" "الكتاب" [7] ##
الحديد" [13] ##"

print("until the 13th word (The-Iron), the number of letters in each
word in the verse: ")

## [1] "until the 13th word (The-Iron), the number of letters in each
word in the verse: "

print(nchar(tmpi[1:13]))

## [1] 3 6 5 8 7 4 6 8 5 5 6 7 6

print(paste("The 13th word, (The-Iron): ", tmpi[13]) )

## [1] "The 13th word, (The-Iron): الحديد"

print("The number of letters until the 13th word, including, (The-
Iron): ")

## [1] "The number of letters until the 13th word, including, (The-
Iron): "

print(sum(nchar(tmpi[1:13])))

## [1] 76

```

6.1.4 Great Evidence of Iron and Quran

Simple code pattern reminder:

For the verse of Iron until and including the Iron word: [Chapter index | verse
index | number of words till the Iron word | Abjad numbers of each of the 76
Arabic letters till the Iron word]

In Evidence 6.1.3, we had used the number of letters until the word Iron in the verse. In this evidence, I will remove the total number of letters, 76, and replace it by placing the corresponding Abjad numbers of each of the 76 Arabic letters. We will witness that, this meaningful coding test have a 131 digits length very long number, which is not only multiple of 26 (the atomic number of iron) but also it is multiple of 26x26x26 (17576). To

help you imagine how great is this code number, let me provide you the the probability of any random number being multiple of 26x26x26, which is 1/17576. Also, note that the digit sum of 17576 is also exactly 26. Below are the details of this evidence.

The coding pattern of this evidence is just like of the Evidence 6.1.3 but we replace the number of letters with the Abjad numbers of each letter until up to the word iron as follows:

Concatenate: 57 25 13 and [Abjad numbers of each of the 76 Arabic letters.]

The resulting 131 digits length coding number, which is multiple of 26x26x26 (17576) is this:

57251330100412006030501200603050121302105014006150730501407054
013020400126130401071503010100640130501602130100609615073050113
084104

This further *suggests* that the Creator of the universe, who also created the iron is also the author of Quran, shows us these undeniable miraculous facts so that we, the people of knowledge, can contemplate and understand that the Quran is the message from God.

Below are the proof to get the above number and multiplicity test:

```
x<- unQuran
tmp1 <- str_split(x$text, " ")
i<- 5155 # General verse index in 6348 for verse 57:25, the hadid
verse.
tmpi <- unlist(tmp1[i])
print("Each word until and including 13th word,Al-Hadid: ")
## [1] "Each word until and including 13th word,Al-Hadid: "
print(tmpi[1:13])
## [1] "معهم" "وأنزلنا" "بالبينات" "رسلنا" "أرسلنا" "لقد"
"وأنزلنا" "بالقسط" "الناس" "ليقوم" "والميزان" "الكتاب" [7] ##
الحديد" [13] ##"
tmp <- AbjadSeqofwordspervVerse(tmpi[1:13], rev_ = F)
print("Abjad sequence values of the Iron verse till Iron word: ")
## [1] "Abjad sequence values of the Iron verse till Iron word: "
print(tmp)
```

```

## [1] "301004"          "12006030501"    "2006030501"
"2130210501400"
## [5] "6150730501"      "4070540"        "1302040012"     "613040107150"
## [9] "3010100640"      "13050160"       "2130100609"     "6150730501"
## [13] "13084104"

tmp <- paste0(tmp, collapse = "")
print("Single big number of Abjad sequence values of the Iron verse
till Iron word: ")

## [1] "Single big number of Abjad sequence values of the Iron verse
till Iron word: "

print(tmp)

## [1]
"301004120060305012006030501213021050140061507305014070540130204001261

# Concatenate 572513 and replace the Abjad numbers of 76 letters with
Abjads:
tmp <- paste0(572513,tmp)
print("Including indexedexes, single big number of Abjad sequence values
of the Iron verse till Iron word: ")

## [1] "Including indexedexes, single big number of Abjad sequence
values of the Iron verse till Iron word: "

print(tmp)

## [1]
"572513301004120060305012006030501213021050140061507305014070540130204
00126130401071503010100640130501602130100609615073050113084104"

tmp131 <- tmp
# Test the 131 digits length number for mod 26 and see if 0.
as.bigz(tmp) %% 26

## Big Integer ('bigz') :
## [1] 0

# Test the 131 digits length number for mod 26x26x26 (17576) and see
if 0.
as.bigz(tmp) %% 17576

```

```
## Big Integer ('bigz') :
## [1] 0

print("The number of digits of the big coding number: ")

## [1] "The number of digits of the big coding number: "

print(nchar(tmp))

## [1] 131
```

The 131 digits length coding number, including indexes:

“57251330100412006030501200603050121302105014006150730501407054013020400126130401071503010100640130501602130100609615073050113084104”

You might use this big number calculator to test it yourself: goodcalculators.com/big-number-calculator/

There are also some further interesting facts with the quotients of this big number.

When we divide the 131 digits length big coding number with 26, it results 130 digits length quotient number and the digit sum of it is 588. By the way, 130 is also 26×5 . Then, when we divide the 131 digits length big coding number with $26 \times 26 \times 26$ (17576), it results 127 digits length quotient number and the digit sum of it is also 588. When I run a simulation to measure the probability of them to be equal randomly, I measure the probability as around %0.8, which is statistically sufficient small probability to consider them potentially not random.

6.1.4.1 From the first verse till the iron word, based on the Great Evidence

Simple code pattern reminder (in 6348 verses):

From the first verse of Quran until the verse of Iron and until and including the Iron word: [Chapter index of verse 1 | special verse index of verse 1 | number of words of words in the verse 1 | Abjad numbers of each of the Arabic letters in the verse 1] [Chapter index of verse 2 | special verse index of verse 2 | number of words in the verse 2 | Abjad numbers of each of the Arabic letters in the verse 2] . . . [Chapter index (57) of the Iron verse | special verse index (25) of verse 1 | number of words of words (13) in the Iron verse | Abjad numbers of each of the 76 Arabic letters in the Iron word]

In Evidence 6.1.4, we had witnessed the Great Evidence of iron in Quran. This code further supports its coding pattern suggest that the same coding pattern also exist from the first verse of Quran untill the Iron word in the Iron verse. Since the Great Evidence code of

Evidence 6.1.4 has an extremely strong coding, I hypothesized that it might be left as a *key coding pattern* and, if so, we should also see the same coding pattern from the beginning of Quran from the first verse till the iron word in the Iron verse. I tested this hypothesis and witnessed that it is also multiple of 26 considering the text type of 6348 verses of Quran. Namely, when we apply the same key coding pattern to each verse and concatenate them until the iron verse, the resulting big coding number is also multiple of 26. This means, the *key coding pattern* of the Great Evidence (Evidence 6.1.4) does not only exist from the first word of the Iron verse till the iron word but it also exist from the first word of Quran in the first verse till the iron word in the iron verse. The “Hamza” letters were not assigned an abjad number as per one of the general Abjad numbers usage. Below is the reproducible R code to verify and witness this supporting evidence code.

```
x<- unQuran
ii <- which(x$chapter== 57 & x$verse==25)
RmHamza=T
j <- which(x$verse==0)
y <- x
tmp1 <- str_split(x$text, " ")

tmp <- c()
for(i in 1:length(tmp1)){
  tmpi <- unlist(tmp1[i])
  tmp <- c(tmp, paste0(AbjadSeqofwordspersVerse(tmpi,
    rev_=F, rmHamza_ = RmHamza,
    abjadL_=abjadL, abjadN_=abjadN2),
    collapse = "" ))
}

tmp1 <- paste0(y$chapter,y$verse,y$vwords, tmp)
if(length(j) >0) tmp1[j] <- paste0(y$chapter[j],y$vwords[j], tmp[j])

tmp <- tmp1[1:(ii-1)] # until iron verse
tmp <- paste0(tmp, collapse = "")
print("Testing the mod 26 for the big coding number until iron
verse:")

## [1] "Testing the mod 26 for the big coding number until iron
verse:"
```

```

as.bigz(tmp) %% 26

## Big Integer ('bigz') :
## [1] 0

print("The number of digits of the big coding number: ")
## [1] "The number of digits of the big coding number: "

print(nchar(tmp))
## [1] 546360

# mathematical property but test to double check.
tmp <- c(tmp1[1:(ii-1)],tmp131) # until iron word
tmp <- paste0(tmp, collapse = "")
print("Testing the mod 26 for the big coding number until iron word:")
## [1] "Testing the mod 26 for the big coding number until iron word:"

as.bigz(tmp) %% 26

## Big Integer ('bigz') :
## [1] 0

print("The number of digits of this big coding number: ")
## [1] "The number of digits of this big coding number: "

print(nchar(tmp))
## [1] 546491

```

This code is based on the Great Evidence code presented in Evidence 6.1.4. The Great Evidence showed that the letters with Abjad numbers and the chapter and verse indexes and the number of words till the iron word was coded as multiple of 26. Even more it was multiple of $26 \times 26 \times 26$, which is 17576. The probability of observing the Great Evidence is $1/(26 \times 26 \times 26)$, which is $1/17576$. Since it was an extraordinary evidence, I hypothesized that it might be left as clue and if we look at from the beginning of Quran till the iron word. It turned out to be true as we witnessed above. Assuming we could also try the same coding in the numbered verses text type, we can roughly estimate the probability of observing this evidence as $2/(26 \times 26 \times 26 \times 26) = 4.3e-06$, which is 1 in 228488 trials.

The “546491” digits length coding number, including indexes:

“114260401303051302008405013020081040124130840430305200213070130401050

6.1.5 Iron verse centered rewriting each letter in Quran with Abjad numbers

In this evidence we have three independent codes of iron verse and they make together another great evidence as they complement each other. These three codes together suggest that full text of Quran can be rewritten around the Iron verse. Therefore, they suggest that all the letters of Quran is intact.

The common coding pattern of each of the three codes is that they are based on rewriting the Arabic text of the verses of Quran by replacing each of the letters with the Abjad numbers as seen on the text. All the codes have *general verse indexes*, which are from 1 to 6236. This means, this code pattern is literally re-writes the verses of Quran by replacing each of the letters with Abjad numbers as seen on the text. These three codes are all around and including the verse of Iron and exist over the numbered 6236 verses of Quran. The codes are generated in the writing direction of Arabic that is from right to left.

Since the codes are too big, I will first provide the brief descriptions of each of the three code below, then I will provide the R scripts to verify the codes and then provide the big codes together in the end.

Code 1: The first code is that when we rewrite the verse of Iron (al-Hadid) as explained above, the resulting code is multiple of 26. 5100 is the index of Iron verse in 6236 numbered verses. The coding pattern is illustrated below:

Code 1 coding pattern:

[General verse index of the Iron verse (5100) | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text]

[5100 <———— CODE IN THE WHOLE IRON VERSE ———|]

Code 2: The second code is that when we rewrite all the verses of Quran from the first verse until the verse of Iron (al-Hadid) as explained above, the resulting big number code is

multiple of 26. Because of the mathematical property, from the beginning of Quran till the verse of Iron, including or exclusive of the verse of Iron, the big numbers of both codes are multiple of 26.

Code 2 coding pattern: The Code 2 till the Iron verse but excluding it is illustrated below.

[General verse index of the Iron verse verse (5100-1) | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text] ... [General verse index of verse 2 | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text] [General verse index of verse 1 | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text]

[To verse 5099<--- CODE TILL (EXCLUDING) THE IRON VERSE ---| From verse 1]

The Code 2 till the Iron verse and including it is illustrated below.

[General verse index of the Iron verse verse (5100) | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text] ... [General verse index of verse 2 | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text] [General verse index of verse 1 | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text]

[To verse 5100<--- CODE TILL (INCLUDING) THE IRON VERSE ---| From verse 1]

Code 3: The third code is that when we rewrite all the verses of Quran from the verse of Iron (al-Hadid) till the end of Quran as explained above, the resulting big number code is multiple of 26. Because of the mathematical property, from or after the verse of Iron, including or exclusive of the verse of Iron, till the end of Quran, the big numbers of both codes are multiple of 26. Therefore, in the below coding pattern illustration, I will first provide the main code from the first verse of Quran till the last verse, which cover all the 6236 numbered verses. I will then also provide the shorter code from the Iron verse till the end of Quran and I will provide the big number of the shorter code to save some space in the book. Because, when we concatenate in the order as Code 2, Code 1 and shorter version of Code 3, then one can obtain the bigger code of the Code 3 in case readers would like to use that big number and test it.

Code 3 coding pattern:

I will first provide the coding pattern of the main code of the Code 3 and then shorter code as well.

The coding pattern from first verse till the last verse of the 6236 numbered verses:

[General verse index of the last verse (6236) | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text] [General verse index of verse (6235) | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text] ... [General verse index of the second verse (2) | Abjad value of each letter in the verse 2 replaced at the place of the letters on the written text] [General verse index of the first verse (1) | Abjad value of each letter in the verse 1 replaced at the place of the letters on the written text]

[To verse 6236<--- THE CODE THAT WROTE THE QURAN FROM BEGINNING TO END ---| From verse 1]

The coding pattern of **the shorter code**, which is from the verse after the Iron verse till the last verse of the 6236 numbered verses:

[General verse index of the last verse (6236) | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text] [General verse index of verse 6235 | Abjad value of each letter in the Iron verse replaced at the place of the letters on the written text] ... [General verse index of the verse after the Iron verse (5100+1) | Abjad value of each letter in the verse after Iron verse replaced at the place of the letters on the written text]

[To verse 6236<--- CODE AFTER THE IRON VERSE ---| From verse 5101]

As per the mathematical property, the above code would also be written from, including the iron verse as this:

[To verse 6236<--- CODE FROM (INCLUDING) THE IRON VERSE ---| From verse 5100]

Considering the three codes described about, because of the mathematical property, it means that from beginning till the end of Quran, if we re-write Quran as described above, the big coding number is also multiple of 26. These codes suggest that there is a strong coding design over the full text of Quran based on the special strong element of universe, Iron, which is the only element given to a chapter name of Quran and also at the center chapter of Quran.

The R codes to reproduce and verify the three codes are presented in order below.

```
x<- nQuran # 6236 numbered verses
ii <- which(x$chapter== 57 & x$verse==25)
print("The General Verse Index of the Iron verse in the numbered 6236
verses is: ")
```

```

## [1] "The General Verse Index of the Iron verse in the numbered 6236
verses is: "

print(ii)

## [1] 5100

#
RmHamza=T # remove Hamza characters as they do not have Abjad numbers.
j <- which(x$verse==0)
y <- x
tmp1 <- str_split(x$text, " ")

tmp <- c()
for(i in 1:length(tmp1)){
  tmpi <- unlist(tmp1[i])
  tmp <- c(tmp, paste0(rev(AbjadSeqofwordspersVerse(tmpi,
    rev_=T, rmHamza_ = RmHamza,
    abjadL_=abjadL, abjadN_=abjadN2)),
    collapse = "" ) )
}
# General verse indexes added
tmp2 <- paste0(1:length(tmp), tmp)

# Code 1, Iron verse.
tmp <- tmp2[ii] # iron verse
tmp <- rev(tmp) # reverse order of verses
tmpc1 <- paste0(tmp, collapse = "")
print("Testing if the mod 26 of the Code 1 number of the iron verse is
0:")

## [1] "Testing if the mod 26 of the Code 1 number of the iron verse
is 0:"

as.bigz(tmpc1) %% 26

## Big Integer ('bigz') :
## [1] 0

print("The number of digits of the Code 1, the iron verse: ")

## [1] "The number of digits of the Code 1, the iron verse: "

print(nchar(tmpc1))

```

```
## [1] 236

###

# Code 2: Until and excluding the Iron verse. (Shorter version)

tmp <- c(tmp2[1:(ii-1)])
tmp <- rev(tmp) # reverse order of verses
tmpc2 <- paste0(tmp, collapse = "")
print("Testing if the mod 26 of the Code 2 number until and excluding
iron verse is 0:")

## [1] "Testing if the mod 26 of the Code 2 number until and excluding
iron verse is 0:"

as.bigz(tmpc2) %% 26

## Big Integer ('bigz') :
## [1] 0

print("The number of digits of the Code 2, excluding iron verse: ")

## [1] "The number of digits of the Code 2, excluding iron verse: "

print(nchar(tmpc2))

## [1] 535957

# Code 2 (longer version): Until and including the Iron verse (With
Iron verse also works by the mathematical property).

tmp <- c(tmp2[1:(ii)])
tmp <- rev(tmp) # reverse order of verses
tmp <- paste0(tmp, collapse = "")
print("Testing if the mod 26 of the Code 2 number until and including
iron verse is 0:")

## [1] "Testing if the mod 26 of the Code 2 number until and including
iron verse is 0:"

as.bigz(tmp) %% 26

## Big Integer ('bigz') :
## [1] 0

print("The number of digits of the Code 2, including iron verse: ")
```

```

## [1] "The number of digits of the Code 2, including iron verse: "
print(nchar(tmp))
## [1] 536193
###

# Code 3 (shorter version): Until the end of Quran, from, excluding,
the Iron verse.
tmp <- c(tmp2[(ii+1):length(tmp2)])
tmp <- rev(tmp) # reverse order of verses
tmpc3 <- paste0(tmp, collapse = "")
print("Testing the mod 26 for the code 3 number till the end of Quran,
from, excluding, the Iron verse:")

## [1] "Testing the mod 26 for the code 3 number till the end of
Quran, from, excluding, the Iron verse:"

as.bigz(tmpc3) %% 26

## Big Integer ('bigz') :
## [1] 0

print("The number of digits of the code 3, excluding iron verse: ")
## [1] "The number of digits of the code 3, excluding iron verse: "

print(nchar(tmpc3))
## [1] 62040

# Code 3 (from Iron verse till end): Till the end of Quran, from,
including, the Iron verse (With Iron verse also works by the
mathematical property).
tmp <- c(tmp2[ii:length(tmp2)])
tmp <- rev(tmp) # reverse order of verses
tmp <- paste0(tmp, collapse = "")
print("Testing the mod 26 for the code 3 number till the end of Quran,
from, including, the Iron verse:")

## [1] "Testing the mod 26 for the code 3 number till the end of
Quran, from, including, the Iron verse:"

as.bigz(tmp) %% 26

```

```

## Big Integer ('bigz') :
## [1] 0

print("The number of digits of the Code 3 (longer version), including
iron verse: ")

## [1] "The number of digits of the Code 3 (longer version), including
iron verse: "

print(nchar(tmp))

## [1] 62276

# Code 3 (All Quran): Until the end of Quran, from the first verse 1
to last 6236.
# Works by the mathematical property as we take the shorter version
upon the first two codes.
tmp <- tmp2 # all the Quran with general indexes.
tmp <- rev(tmp) # reverse order of verses
tmp <- paste0(tmp, collapse = "")
print("Testing if the mod 26 for the Code 3 (longer version), from
verse 1 till the end of Quran (6236) is 0:")

## [1] "Testing if the mod 26 for the Code 3 (longer version), from
verse 1 till the end of Quran (6236) is 0:"

as.bigz(tmp) %% 26

## Big Integer ('bigz') :
## [1] 0

print("The number of digits of the Code 3 (all Quran): ")

## [1] "The number of digits of the Code 3 (all Quran): "

print(nchar(tmp))

## [1] 598233

```

As we witnessed above, all the three codes are multiple of 26. We also further provided validation for the longer versions of the codes that must also be multiple of 26 by the mathematical property. Since we could also test these 3 codes in the text type of all 6348 verses, the probability of witnessing this evidence with the three codes might be estimated as $2/(26 \times 26 \times 26) = 2/17576$, which is 1 in 8788 trials. Below, I will provide the big numbers of each of the code as sub-chapters for easy access to them for testing.

You might use this big number calculator to test it yourself: goodcalculators.com/big-number-calculator/

6.1.5.1 Code 1 big number

The Code 1 number of the iron verse is printed here. The “236” digits length coding number of the Code 1 of the Evidence 6.1.5:

“51007107701061005303015012101000301253060200652009050105040530301403070103066015030307080150406410430060125108041048301150307501696010030126015030140610010305017104030162140020301405704015030750164001501023012150306020015030602001410030”

You might use this big number calculator to test it yourself: goodcalculators.com/big-number-calculator/

6.1.5.2 Code 2 big number

The Code 2 number until and excluding iron verse is printed here. The “535957” digits length coding number of the Code 2 of the Evidence 6.1.5:

“50994104083011050100030165530301501803064001050406306002301260150301506200401106506306002105010700301509820066008030140060040302028101305303016402014001140216820080400130640204001801401030701660140013010203050972001060105303011030702030700501151200250501302100504021400201080130140206080501108013068002001301108052109040504021901140509640109007030130800803016700530301613001050405104006105303013080080203070053060200653030121650401501070030304004701800200130161406030180020070201580020070550364020220050405200801000401030116100216050952006200100030170140040130111050430151108301140650168002006530301504052008010004064104300217007052006001301108061401985062010405001200809040512004008031051040500540012502001802030123701500101000305004020413061301630164013011080200500120400640205010220060018040065501076653062703011050430151108301140501164030701509440108330121890120103061150400110121627002061620080205010700301640520065064052003140530405220045070145300301650610010490301405201030615306020065303012165040150107003016509340102002020031405306405308070180010150608180020010053030116800200100164001100490403016501010049040301501509250630100704004020307030400110130140203015010241001540064047028002001301101081053030150116403070150915061006018040550402001050020640526301004006010080440130140510307030198030210050402140020301164006150107003012016506201013061008301504030750140653030120020700304052630100703006004005011650401501070030305011040301509020010904030160102640201306

You might use this big number calculator to test it yourself: goodcalculators.com/big-number-calculator/

6.1.6 Rewriting Codes of Quran based on 26

In the previous Evidence 6.1.5, we observed 3 codes that complemented each other. However, because of the mathematical property, concatenating the 3 codes together, would give us another code that represent rewriting Quran with Abjad numbers. I had observed the Code 3 (full text version) of Evidence 6.1.5, which rewrites the full text of 6236 numbered verses of Quran based on 26. I call that code, which is multiple of 26 and represents the full text of the 6236 numbered verses of Quran as Code 1 in this current chapter (6.1.6) to track all the codes to be presented under this chapter. As I mentioned, that big code is a result of mathematical property considering the other 3 codes in Chapter 6.1.5. However, this made me question whether this particular interesting coding pattern is any special and are there other similar codes that represent rewriting the full text of Quran based on number 26 as well. I then tested the exact same coding pattern using all the 6348 verses of Quran and witnessed that the resulting big coding number is also multiple of 26. I name this new code as Code 2 of this chapter. Before explaining the other codes, I illustrate these two codes here:

Code 1: As mentioned above, this is the same code described in the Code 3 (full text version) of Evidence 6.1.5, which rewrites the full text of 6236 numbered verses of Quran based on 26. As there are related other codes to this coding patterns, I rewrote it in this section. It is based on rewriting the Arabic text of the verses of Quran by replacing each of the letters with the Abjad numbers as seen on the text. The *general verse indexes*, which are from 1 to **6236**, are added at the beginning of each verse. This means, this code pattern is literally re-writes the verses of Quran by replacing each of the letters with Abjad numbers as seen on the text. The coding pattern from first verse till the last verse of the 6236 numbered verses is as follows:

[General verse index of the last verse (6236) | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text] [General verse index of verse (6235) | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text] ... [General verse index of the second verse (2) | Abjad value of each letter in the verse 2 replaced at the place of the letters on the written text] [General verse index of the first verse (1) | Abjad value of each letter in the verse 1 replaced at the place of the letters on the written text]

[To verse 6236<--- THE CODE THAT WROTE THE QURAN FROM BEGINNING TO END ---| From verse 1]

Code 2: It is same as Code 1 but in all the 6348 verses of Quran. The coding pattern from first verse till the last verse of the 6348 verses is as follows:

[General verse index of the last verse (6348) | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text] [General verse index of verse (6347) | Abjad value of each letter in the Iron verse replaced at the place of the letter on the written text] ... [General verse index of the second verse (2) | Abjad value of each letter in the verse 2 replaced at the place of the letters on the written text] [General verse index of the first verse (1) | Abjad value of each letter in the verse 1 replaced at the place of the letters on the written text]

[To verse 6348<--- THE CODE THAT WROTE THE QURAN FROM BEGINNING TO END ---| From verse 1]

Additional facts related to Code 2: The pattern of Code 2 is further interesting if we write the Abjad numbers in a verse in normal order (left to right) instead of the written text order from right to left as in Arabic. If we generate that version of this pattern, then the resulting big number is still multiple of 26. Moreover, with such pattern, if we look at the part of the code that covers from verse 1 till the Iron verse (inclusive), that code is also multiple of 26. Therefore, as per the mathematical property (as if the triangle is completed), the same coding pattern must hold after iron verse till the end of Quran.

Code 3: It is similar to Code 1 but instead of Abjad sequence, we used Abjad value of each word. Abjad value of a word is calculated by summing the abjad numbers of each letter in a word. The coding pattern from first verse till the last verse of the 6236 numbered verses is as follows:

[General verse index of the last verse (6236) | Abjad value of each word in the verse replaced at the place of the word on the written text] [General verse index of verse (6235) | Abjad value of each word in the verse replaced at the place of the word on the written text] ... [General verse index of the second verse (2) | Abjad value of each word in the verse replaced at the place of the word on the written

text] [General verse index of the first verse (1) | Abjad value of each word in the verse replaced at the place of the word on the written text]

[To verse 6236<— THE CODE THAT WROTE THE QURAN FROM BEGINNING TO END (With Abjad values of each word) —| From verse 1]

This code, which is based on Abjad values of each word, is further interesting because if we write the code from the opposite direction, it is still multiple of 26 Namely, in both directions, this big code is multiple of 26. Moreover, in this opposite direction, if we take the part of the code from first verse till the Iron verse (inclusive), it is also multiple of 26.

Over all, with the general verse index and in the writing order (right to left as in Arabic) of the letters, words and verses, we observed 3 rewriting coding multiple of 26 out of 4 possible cases. Binomial test shows that such an event has the probability of around 1 in 4500 Here is the probability calculation of it:

```
tmp <- binom.test(3, 4, p = 1/26, alternative = c("greater"))
# tmp$p.value # 0.0002210182

tmp1 <- formatC(tmp$p.value, format = "e", digits = 2)
print(paste("The probability of", 3,
            "successes out of", 4,
            "(with p=1/26) is:", tmp1))

## [1] "The probability of 3 successes out of 4 (with p=1/26) is:
2.21e-04"
```

I will not include the successes of this evidence to the overall probability of this book to keep its final probability more conservative.

The R codes to reproduce and verify the three codes are presented in order below.

```
tmpfunction <- function(x){
ii <- which(x$chapter== 57 & x$verse==25)
RmHamza=T # remove Hamza characters as they do not have Abjad numbers.
tmp1 <- str_split(x$text, " ")
tmp <- c()
for(i in 1:length(tmp1)){
  tmpi <- unlist(tmp1[i])
  tmp <- c(tmp, paste0(rev(AbjadSeqofwordspersVerse(tmpi,
    rev_=T, rmHamza_ = RmHamza,
    abjadL_=abjadL, abjadN_=abjadN2)),
    collapse = "" ) )
}
```

```

}
# General verse indexes added
tmp2 <- paste0(1:length(tmp), tmp)
return(tmp2)
}

# Code 1 (6236 verses Quran): From the first verse 1 to last verse.
